

Wheel

Inspired by *Forged in the Dark* Clock mechanics and *Dungeon World*'s Fronts I have decided to represent every kind of opposition facing the players, either abstract or concrete, into Wheels. In the [art of memory](#) tradition, wheels of any sorts where used as mnemonic devices and even machines for generating new knowlegde and rhetorical statements, such as in the case of [Giulio Camillo](#)'s *artificiosa ruota* and the pedagogical devices of [Orazio Toscanella](#). Such combinatorial wheels originates in the Medieval writings of [Ramon Llull](#), and are considered the precursors of our modern algorithmic thinking.

Each Wheel is divided in [Segments](#), which number is proportional to its inherent difficulty.

The rank of a Wheel represent its number of Segments. Players' actions, such as accepting to share their [Resonance Pool](#), or circumstances dectated by [Major Arcanas](#) can promote a Wheel to an higher rank.

Every opposition to the players in the world is mapped into a Wheel, abstracting its inherent degree of difficulty according to its number of [Segments](#).

Wheels and their rank

Rank	Number of Segments	Description
Line	2	Wheel used to represent minor oppositions, such as villain's minions or a non-complex task like convincing a

		guard or climb a wall.
Scene	4	The standard rank for a new Wheel. It represent some non-trivial task with a certain degree of complexity, or a tough opponent.
Act	8	A challenging opposition, usually representing a boss or a complex task.
Opus	16	A problem for the player characters that will play a major role in their chronicles.

Exhausted Wheels

Once the [Gathering](#) exhausts a number of Wheels equal to the sum of the digits of the current Major Arcana for the [Scene](#), the [Host](#) can close the chapter and resign their priviledged position.

When all the Segments of a Wheel are filled by players' [Triumphs](#) it is declared as exhausted. In the fiction, this means that the opposition has been resolved by the characters.
